We've been looking forward to the OpenMandriva Lx 4.0 release for a number of months now with Lx 3.0 having debuted two years ago. Fortunately, that release is inching closer to release as this week the alpha release is now available for testing.

OpenMandriva Lx 4.0 is a big release and as such is taking a long time to get into shape for release. Some of the big ticket items include switching back from RPM5 to RPM4, utilizing Fedora's DNF package manager, shipping with Linux 4.17~4.18 , LLVM Clang 7 as the default compiler while GCC 8 is also available , complete support for AArch64, and a variety of package updates.
