In addition to working on OpenMandriva Lx 4.0 as this distribution's next major release with its roots tracing back to the legendary Mandrake, its developers have also been working on clean ports of this Linux distribution to other CPU architectures.

OpenMandriva has been working on expanding its focus from just Intel x86\_64 to a good experience for AMD Ryzen AMD64 and ports to AArch64 and RISC-V too. They are doing since as "other CPU architectures are starting to be fast enough" for desktop/laptop use-cases and "monopolies are harmful."
