Being basically a pimped up cell phone requires a convergence of Linux (glibc) and Android (bionic) to drive the hardware not yet natively supported by GNU/Linux. We are using components from the Halium project to achieve that.

Bringing GNU/Linux to the Gemini PDA, or any other mobile platform, is in the very early stages and some of it still needs a bit of work, such as data and voice support, GPS, power management, etc. There is currently one known issue with the Gemini having occasional issues when shutting down. The community is currently working on it.

Overall, it's a very stable experience thanks to the hard work of the Sailfish and Gemian communities, in particular TheKit and adam_b, who brought Gemian to the Gemini PDA and helped a lot with this project.
