My understanding is that elementary OS and openSUSE Tumbleweed couldn't be more different. The former is designed to be lean, minimalistic and beginner-friendly, while the latter has a wealth of software bundled in (its 2x larger ISO download size makes that obvious), allows users to choose multiple desktop environments during the installation and can be heavily customized.

[...]

By default, I don't expect to have issues with Linux OS installers. The ones I've reviewed -- such as Deepin and Pop!_OS -- have been attractive, intuitive affairs. For those of you who haven't tried Linux in years, they're incredibly simple compared their past iterations.

The standard graphical installer for openSUSE Tumbleweed, however, threw me a curveball.

Advancing through initial options like network setup, region, packages and desktop environment was straightforward. But then as the install process began I was met with puzzling "Wrong Digest" messages.
