Internet radio is a great way to listen to stations from all over the world. Like many developers, I like to turn on a station as I code. You can listen to internet radio with a media player for the terminal like MPlayer or mpv, which is what I use to listen via the Linux command line. However, if you prefer using a graphical user interface (GUI), you may want to try GNOME Internet Radio, a nifty plugin for the GNOME desktop. You can find it in the package manager.

Listening to internet radio with a graphical desktop operating system generally requires you to launch an application such as Audacious or Rhythmbox. They have nice interfaces, plenty of options, and cool audio visualizers. But if you want a simple, straightforward interface that gets your streams playing, GNOME Internet Radio is for you.
