Managing Linux servers has never been easy. Programs like Cockpit, cPanel, and Webmin use a GUI to make it simpler to handle common sysadmin tasks. But, with servers moving from the racks in your server room to the cloud and the edge and the Internet of Things (IoT), we need more. That's where DevOps comes in. And now programs like the new SUSE Manager 4 combine the best of both sysadmin approaches.

Daniel Nelson, SUSE VP of products and solutions, explained in a statement: "SUSE Manager manages physical, virtual, and containerized systems across edge, core, and cloud environments, all from a single centralized console. It's part of the IT transformation that lowers costs, reduces complexity, and boosts business agility."
