There have been a total of five openSUSE Tumbleweed snapshots since the beginning of July and all the snapshots have a strong, stable rating.

The rolling release had the most updates arrive in the 20190702 snapshot. The packages update in that snapshot included Mesa 19.1.1 and Mesa-drivers 19.1.1 that had fixes for Intel ANV and AMD RADV driver as well as Nouveau and R300 Gallium3D drivers. The bzip2 file compression application fixed undefined behavior in the macros in version 1.0.7 and fixed a low impact Common Vulnerabilities and Exposures (CVE). The programming language package guilef was updated to version 2.2.5 and provided bootstrap optimization. Portability improvements were made in the library for encryption, decryption, signatures and password hashing with libsodium 1.0.18. A major release of the PulseAudio's Volume Control package pavucontrol 4.0 was made; the new version dropped support for Gtk+ 2 and added more than a handful of new language translations.

The most recent snapshot, 20190708, didn't offer a changelog due to the server that the web app uses to produce the changelogs being upgraded to Leap 15.1. The changelog is expected to be included in the next snapshot that is released.
