- [Free accounting software South Africa](#) [2]

GnuCash is one of the best open source accounting software that is 100% free. It offers simplicity, flexibility, and amazing features such as handling multiple currencies and some payroll features. The application is available on Android, Linux, OpenBSD, Windows, GNU, and macOS devices. Some of the other features are managing accounts payable and receivable and managing employee expenses.

- [Linux super-duper admin tools: health-check](#) [3]

Health-check is a very useful, practical tool. It does not replace strace or netstat or perf, but it can sure help you get a very accurate multi-dimensional snapshot of whatever you're profiling. This is a very good first step that can point you in the right direction. You can then select a utility that specifically examines the relevant facet of the software run (maybe Wireshark for network or Valgrind for memory). In a way, this makes health-check into a Jack o' All Trades.

You do need some understanding of how Linux systems work - and the application you're running. But even if you don't have that knowledge, health-check can be used for comparative studies and troubleshooting of performance bottlenecks. If you know something isn't running quite as well as it should, you can trace it once on a good system, once on a bad (affected) system, and then compare the two. The many types of data that health-check provides will greatly assist in solving the issue. And that brings us to the end of this tutorial. With some luck, you have learned something new, and it was an enjoyable ride, too. Take care.

- [Xsnow ? Snow on Your Desktop in Ubuntu 18.04 / Higher](#) [4]

Xsnow, let it snow on your desktop, now is working on Gnome, KDE, FVWM desktop in Ubuntu 18.04 and higher.

Xsnow is a handy command tool that brings Christmas to your desktop. However, it does not work properly in Ubuntu since Ubuntu 12.04 Precise.

Now a brand new Xsnow based on the original xsnow-1.42 is available to work on many desktop environments, along with a simple graphical interface.
