Portable consoles are hardly new, and thanks to the Switch, they're basically the most popular gaming devices in the world. But ClockworkPi's GameShell is something totally unique, and entirely refreshing when it comes to gaming on

the go. This clever DIY console kit provides everything you need to assemble your own pocket gaming machine at home, running Linux-based open-source software and using an open-source hardware design that welcomes future customization.

The GameShell is the result of a successful Kickstarter campaign, which began shipping to its backers last year and is now available to buy either direct from the company or from Amazon. The \$159.99 (on sale for \$139.99 as of this writing) includes everything you need to build the console, like the ClockworkPi quad-core Cortex A7 motherboard with integrated Wi-Fi, Bluetooth and 1GB of DDR3 RAM ? but it comes unassembled.
