Not too much noise has been made about it, but fairly recently SailfishOS for Sony Xperia XA2, XA2 Ultra and XA2 Plus (finally) came out of beta stage after the initial release last autumn. I went and got myself an XA2 Plus and have been using it for a week now and am very pleased with it. Compared to former SailfishOS devices the Android runtime for the XA2 models is at version 8.x (compared to 4.x for previous devices), meaning a lot more Android apps will run on it.

So if you're looking for a proper GNU/Linux phone and/or an alternative to the Google/Apple duopoly now is your chance to run SailfishOS on very decent and affordable midrange hardware. Below is a video of the XA2 Plus running SailfishOS (not mine).
