One of the traits I love about Linux is the breadth of open source available. And music players are no exception. There?s many excellent open source music players available ranging from sublime GUI software like Tauon Music Player to terminal based software such as musikcube. They are two of my favorite audio apps. But there?s always room for more.

Sayonara Player is another quality music player. It?s under active development. It caught my eye for a number of reasons, not least its large range of features. Let?s see what it has to offer.

The program is written in C++, supported by the Qt framework. It uses GStreamer as its audio backend.
