In addition to announcing systemd-homed for better user home directories, Lennart Poettering also used this year's All Systems Go conference to drum up support for systemd's boot efforts around SD-Boot and the Boot Loader Specification.

systemd-boot/sd-boot is systemd's UEFI boot manager formerly known as Gummiboot. SD-Boot continues picking up new functionality and at least optional usage by more distributions. The Systemd Boot Loader Specification (also known as the FreeDesktop.org Boot Loader Specification) meanwhile is trying to assist use-cases around dual/multi-boot operating system setups and related use-cases with drop-in file handling, standardized configuration files and the like.
