If you're a livestreamer, video creator or anything like that then the Elgato Stream Deck seems like an incredible useful

bit of kit. However, it doesn't have official Linux support. Not so much a problem now.

The Stream Deck is a handy little pad with a bunch of LCD buttons, that allows you to configure each button to some sort of action and image. You could use it to one-touch launch an animation, show your contact details on screen, switch to a difference scene in OBS Studio and so on. There's a huge amount you can do with it and not having Linux support was a shame.

Announcing the release of streamdeck_ui on their blog, developer Timothy Crosley hooked into the also open source Python Elgato Stream Deck Library project to create a fully featured interface for working with the Stream Deck hardware on Linux.
