To counter some recent FUD spread about Calibre in general and Calibre in Debian in particular, here a concise explanation of the current state.

Many might have read my previous post on Calibre as a moratorium, but that was not my intention. Development of Calibre in Debian is continuing, despite the current stall.

Since it seems to be unclear what the current blockers are, there are two orthogonal problems regarding recent Calibre in Debian: One is the update to version 4 and the switch to qtwebengine, one is the purge of Python 2 from Debian.
