In bug 1566207 I added support for Heroku Review Apps ([link to official docs](#)). This feature allows creating a full Treeherder deployment (backend, frontend and data ingestion pipeline) for a pull request. This gives Treeherder engineers the ability to have their own deployment without having to compete over the Treeherder prototype app (a shared deployment). This is important as the number of engineers and contributors increases.

Once created you get a complete Heroku environment with add-ons and workers configured and the deployment for it.

Looking back, there are few new features that came out of the work, however, Heroku Review apps are not used as widely as I would have hoped for.
