One of the main reasons I build a computer was for the purposes of hosting my video content on my system and serve it to other machines. I had heard about having something like Netflix or Hulu in the form of Plex. I have known others that have done this and have always been impressed by it. My first step in exploring media servers in Linux was Emby. I chose it largely because I heard of Plex and wanted to try something that was open source based, more on that later. At the very beginning of this exercise, I decided I want to try out three different server products, Plex, Emby and Jellyfin.

This is my review, with no real expectations, other than to easily have access to my movies and TV shows from any device in the house. This is a review of only the free services, not the paid features. Bottom line up front. I like it and it has few issues.
