Right off the cuff, I should note that this will work on other Linux distros too, I am just focusing on openSUSE because, that is my jam. I have been using this on openSUSE Tumbleweed as of Snapshot 20200103. It should also work on Leap as of 42 and newer (that means Leap 15.x is good to go, in case there was any question).

The reason this application excites me so is that I use several AppImages on my system. Which ones you may ask? I'll tell you, xLights, which I use for my Christmas Light display, VirtScreen that I use when I am remote and need to turn my laptop or phone into a second display. This is super handy as it will not only create links in my menu to the AppImages, it will also copy the *.AppImage file into a designated folder, in my case ~/Applicaitons which is the default. At first, I wasn't sure about it but after noodling it around a bit, I am totally good with it.
