I recently purchased a new Logitech wireless keyboard for my kitchen computer because the Bluetooth keyboard I previously used was driving me nuts. Mostly for the keyboard layout and sometimes because it didn't want to connect. Possibly due to hardware failure or bad design. It also doesn't have media keys so I thought it best just to replace it.

I have previously used Itunify with success but I only used it because 'L' comes before 'S' so that was my first stop. Since I received feedback that I should try Solaar I did so this time. Since there isn't an official Linux based application available from Logitech, the fine open source community has stepped in to make managing your devices simple and straight forward.

[...]

Having Solaar in the system try is quite handy. Though, the reality is, I don't need it all the time but having it to manage your devices is very handy. It's nice to know that you can manage multiple Unifying receivers with this application. This is easy to use and has a great, well laid out and straight forward interface. I am glad I was

recommended to try this application out.
