Rclone Browser (fork), a Qt5 GUI for Rclone, was updated to version 1.8.0, getting proxy support, an option to display the complete directory tree for a remote, and the ability to create a public link to easily share files, among others.

Rclone Browser is a cross-platform (Windows, macOS and Linux) Qt5 GUI for Rclone, a command line tool to synchronize (and mount) files from remote cloud storage services like Google Drive, OneDrive, Nextcloud, Dropbox, Amazon Drive and S3, Mega, and others.

This GUI can be used to simplify operations like copying a file from one cloud storage to another or to the local drive, mount cloud storages on your system with a click, and browsing the contents of various cloud storage remotes in a tabbed interface.
