You have probably seen the abundance of smart homes and how they make life easier. These smart homes have been made possible by the Internet of Things and can help users turn lights on and off or play music just by the command of your voice.

To make this possible, you need to have the right hardware and software that can undertake these tasks. Some smart home users have chosen to use Linux to power their homes and have had great success at it.

You need to know the facts about Linux first before using it and familiarize yourself with working around it. Here are some of the best tips for lazy but smart Linux home users to create the best setup.
