Sims4 is an online real-life simulation game that creates a virtual environment quite similar to the real world. For gamers, it is relatively similar to Second Life only that some of the features are different.

With Sims4, players are provided with a platform to create a virtual character (a sim) of themselves. They control the sims to interact with other personalities and change with the game outlook. It's more like having another life online. You can even create challenges like creating a single sim and ensuring that its family lasts for up to ten generations.

Out of Space from developer Behold Studios (Chroma Squad, Galaxy of Pen & Paper) just recently released, and they added Linux support just before leaving Early Access.

It's an odd and quite amusing game, where you and friends are basically space janitors cleaning up your spaceship. With support for local and online multiplayer (matchmaking and invites possible), as well as Steam Remote Play, there's plenty of opportunities to team up with someone to play.
