SUSE, a major Linux and open-source cloud company, will help any organizations building medical devices to fight COVID-19.

The Germany-based company is doing this by offering free support and maintenance for its flagship SUSE Linux Enterprise Server (SLES) operating system and container technologies. These can be embedded in medical devices. These SUSE programs and their support packages are available immediately to meet the urgent demand to get medical devices into the hands of users as fast as possible.
