Leantime is an open source project management software licensed under the GPL 2.0 license. It is written in the PHP language and uses the MySQL database system for storing its data.

Leantime employs the techniques of agile project management in its workflow. Your employees will be mainly divided into projects with each project having its own members, sprints, milestones, todo lists and other important business components.

Of course, there are many nice features for each of these components in Leantime; You can assign members of your teams to specific tasks and limit them by a deadline, you can share ideas and comments with them, you can work with them on creating a business product using the 'Research' component where you identify the problem and purpose a solution? Much much more.

A software such as Leantime could be useful for you if you have a small or medium sized company, and you want to manage your company remotely with as much less hassle as possible.
