How often have you scanned a letter, a certificate or whatever and looked for the right way to call \$UTILITY to convert it to a PDF that can be shared via internet?

For this very common use case I could not find a tool to make that really easy for the Linux desktop. Given my mission to help making the Linux desktop more common in the small business world (do you know Kraft?) I spent some time starting this little project.

Please welcome PDF Quirk, the desktop app to easily create PDFs out of images from storage or directly from the scanner!
