The Raspberry Pi foundation has recently launched the Raspberry Pi 400, a whole computer built into a compact keyboard to make personal computers more affordable. We are glad to say that they have successfully provided us with a PC for just \$70. This version of the Pi is supposed to be cooler and faster than the Pi 4, which is 40 times powerful than the original Pi. The foundation has also come up with a ready-to-go kit available for only \$100.

Regarding the 'computer-in-a-keyboard,' Raspberry Pi 400 has been successful in being an excellent general-purpose computer. Though it can never be the substitute for a modern laptop or desktop computer, you can still do several things with it, including edit documents, search on the web, send an email or browse social media. Also, you can use it as an online learning center for your kids. So, in brief, this version of the Pi has successfully carried out the goals made by the Raspberry Pi foundation.
