When it comes to single-board computers, nothing can beat the popularity of the Raspberry Pi. These tiny boards are not only affordable but also very user-friendly and offer excellent performance. Among these Pi models, the latest version, the Raspberry Pi 4, is supposed to be the most powerful and best of all. Since its launch, the 4k resolution display and the higher speed ethernet port have caught our attention, and we were inspired to give it a try.

We have to say that this model is highly satisfying and the best tiny desktop computer you can get. However, like most other things, Pi 4 has some disadvantages, like getting heated or not compatible with older software. This article will give you a thorough explanation of all the changes, performance, and disadvantages of Pi 4. Stick to the end to know whether this new version is worth your money or not.
