Those who love Ubuntu will be pleased to know that it's now safe to upgrade to the latest version. The latest iteration of Ubuntu came out towards the close of last month. Code named Hirsuit Hippo, Ubuntu 21.04 is mostly about tweaks, bug fixes and invisible improvements. Its biggest calling card is the fact that its GUI interface is powered by Wayland instead of the traditional Xorg.

Although it was released last month, the Ubuntu team discovered a severe bug which prompted them to write code to stop the usual upgrade button from showing to those who were using Ubuntu 20.10.
