Earlier this week when posting Ubuntu 20.04 LTS / 20.10 / 21.04 benchmarks on the new Intel Xeon Platinum 8380 "Ice Lake" server processors, one of the first questions that came up was about how well these new 10nm server CPUs perform with Intel's own Clear Linux distribution. While Clear Linux releases have become much less frequent and far less to communicate these days on new improvements/optimizations among other ongoing shifts with that Intel open-source project, it is still performing very strongly with 3rd Gen Xeon Scalable hardware. CentOS in these tests also had a strong showing with the increasing performance focus on that front.
