Official GNOME 40 for Debian and Ubuntu is coming. This is guide howto build GNOME 40.2 now and run it as your desktop environment. This is actually a bit more than just building exact GNOME 40 Desktop, this is your Swiss Army Knife to build latest GNOME packages when you want and survival pack to help you live on bleeding edge. GNOME 40 is, of course, a major release, but also all minor releases GNOME 40.1 / 40.2 / 40.3 / 40.4 / 40.5 / 40.6. brings something new. Also GNOME 41 is coming in October 2021 <https://wiki.gnome.org/FortyOne>.

If you are ?one-click man?, ?looking always easiest way to do something? and ?wonder why I have to do something more than just click somewhere to get something?, then this is definitely not for you. Even if all the planets are in just the right position, this will still take a while and this is so much complicated than one click. You maybe will see errors and you might have to learn something new, but if you still want to run latest and greatest GNOME on Debian or Ubuntu, then this guide is for you.
