Sometimes file thumbnails in Nautilus aren't enough. Sometimes you need a closer look at a file, photo, or folder to make sure it's the one you actually want, but without the hassle of opening a full-blown app to find out.

And that's where GNOME Sushi comes in.

GNOME Sushi is an alternative to macOS "Quick Look" for Linux desktops that use Nautilus, aka GNOME's famous file manager.

You select a file in Nautilus, tap the spacebar, and an instantaneous (and usually interactive) preview of the file appears - no need to open a full app.

Sushi supports file previews for most plain-text documents, including scripts with syntax highlighting, as well PDFs, HTML files, and LibreOffice documents. Music and video file previews use the GStreamer framework to let you to seek/scrub through them.
