You may associate Linux with the freedom to make your desktop look however you want, but that's not the case with GNOME. At least, not without knowing which extensions to install or how to read code. By default, GNOME is intended to look and feel a certain way, and many developers would prefer if Linux distributions didn't change the appearance of their apps by using themes.

Is it an issue when you change the theme on your own personal machine? No, you know what you're getting yourself into. But confusion can arise when the customized experience comes presented as the default.
