When most people hear about Linux distributions they most likely think of alternative operating systems to Windows or macOS , to distros like Ubuntu, Linux Mint, perhaps Arch or Fedora.

Complete systems to use on a day-to-day basis, edit documents, browse the web, consume multimedia content, etc. However, in the world of Linux what is left over are niches, and for almost any niche you can imagine there is a special distribution . These are just some of them.

It is important to clarify that all these systems are designed with one or more quite specific and determined purposes, and are far from being an alternative for those who are simply looking for a distro to use as their main system to do ?normal? things.

These distros have their uses, and it ?s nice to know of their existence in case we need something like that one day . But to replace personal use operating systems that serve for most regular operations, they do not go.
