Windows is the most widely used operating system, both in home and business environments. Most of the programs are created to run on this operating system. However, the people who create these programs (developers, programmers and system administrators mainly) prefer to leave Windows aside and work on another operating system: Linux. Why? What brings you to this?

Linux offers a large number of advantages when it comes to working and developing, advantages that range from flexibility to security and system performance. Today, Linux is a perfectly affordable system for any user, since it is not much more complicated to use than any Windows system. However, this OS does not end up gaining popularity within home environments, its main strength being the servers and the computers of the programmers.
