Going on for more than a half-decade now has been the effort around Linux Random Number Generator as a new /dev/random implementation for Linux. After more than five years, LRNG continues to work towards being mainlined and today marks the 43rd revision to these patches. LRNG continues baking as a "production ready" implementation of /dev/random that follows different design changes from the existing kernel implementation. It is though a drop-in replacement with the same API/ABI.
