- redshift GUI tray app [2]

    EasyOS has a GUI for /usr/bin/sct (set color temperature), 'brightness-control-1.2.2.pet'.

- XorgWizard fixed for Radeon card [3]

    ...I mentioned that it has fans all over the place -- there is also one on the side-panel, not shown in photo.
    The guy who sold it to me had configured it as a gaming machine, and it had a Radeon Bart XT PowerColor HD6870 card, with 1GB RAM, two DVI-I sockets and one hdmi socket.
    Soon after acquiring the PC, I took the card out and only used the on-board Intel video. Moved house a few times over the years, and that card got lost. Until now, found it in my car, under a seat. So, it is now back in the PC, and it works fine.
