Samba is a suite of Unix applications that speak the SMB (Server Message Block) protocol. Many operating systems, including Windows and OS/2, use SMB to perform client-server networking. By supporting this protocol, Samba allows Unix servers to get in on the action, communicating with the same networking protocol as Microsoft Windows products.

Install Samba in Debian

```
#apt-get install samba samba-common samba-client
```

This will start samba installation and prompted for the following questions

First you need to enter the Workgroup/Domain Name in this example i am using ruchi

select ok and press enter
