- [eBPF - Understanding How It Works](#) [2]

In a lot of scenarios, eBPF is not used directly but indirectly via projects like Cilium, bcc, or bpftrace which provide an abstraction on top of eBPF and do not require to write programs directly but instead offer the ability to specify intent-based definitions which are then implemented with eBPF.

- [How To Install Docker on AlmaLinux 9 - idroot](#) [3]

In this tutorial, we will show you how to install Docker on AlmaLinux 9. For those of you who didn't know, Docker is basically a container engine that uses the Linux Kernel in order to create the containers on top of an operating system. Docker provides a portable environment for both development and production environments. You can create a container from one set of files that works anywhere else without having to worry about dependencies being different on each new server.

This article assumes you have at least basic knowledge of Linux, know how to use the shell, and most importantly, you host your site on your own VPS. The installation is quite simple and assumes you are running in the root account, if not you may need to add `?sudo?` to the commands to get root privileges. I will show you the step-by-step installation of the Docker CE on AlmaLinux 9. You can follow the same instructions for CentOS and Rocky Linux.

- [How to Use tree to Show a Directory Tree in the Linux Terminal](#) [4]

With the tree command on Linux, you can view your entire filesystem in a hierarchical tree-like representation. Here's how to do it.

While you may use ls in the Linux terminal to display directories, what if there was a tool that could show the directory listings hierarchically, like a tree? Fortunately, such a program does exist, and it's called "tree."
