This is a detailed description about the steps to be taken to setup a Mandrake 10.2 based server that offers all services needed by ISPs and hosters (web server (SSL-capable), mail server (with SMTP-AUTH and TLS!), DNS server, FTP server, MySQL server, POP3/IMAP, Quota, Firewall, etc.). In addition to that I will show how to use Debian's package manager apt on an rpm-based system because it takes care of package dependencies automagically which can save a lot of trouble.

I will use the following software:

- Web Server: Apache 2.0.x
- Mail Server: Postfix (easier to configure than sendmail; has a shorter history of security holes than sendmail)
- DNS Server: BIND9
- FTP Server: proftpd
- POP3/IMAP servers
- Webalizer for web site statistics

In the end you should have a system that works reliably and is ready for the free webhosting control panel ISPConfig (i.e., ISPConfig runs on it out of the box).

I want to say first that this is not the only way of setting up such a system. There are many ways of achieving this goal but this is the way I take. I do not issue any guarantee that this will work for you!
