With new releases of the kernel coming every two to three months, Linux continues to test the limits of the open-source development process. Moving forward, the roadmap for the open-source operating system indicates a constant drive to add features, while maintaining quality and stability.

To get some perspective on what lies ahead in 2008, we caught up with Linus Torvalds via email. His responses touched on the Linux development process, upcoming features, and whether he's concerned about potential patent litigation.

InformationWeek: Is Linux kernel development proceeding faster than Windows Server development?

Torvalds: I'm the wrong person to ask, for multiple reasons. First off, I'm somewhat biased, of course. But the other reason is that I don't even know -- or really care -- how Windows Server development actually proceeds, so how could I even compare and make an intelligent point?

I simply don't use Microsoft products, not because I hate them, but because they aren't interesting to me.

So, yes, with the above really big caveats, I obviously do believe that Linux development tends to be a lot more efficient than the alternatives -- both inside the kernel but in many ways even more so in all the things going on around it. And I don't mean Windows in particular, I mean any behind-closed-doors-commercial-proprietary model.
