The development process of SUSE Linux 10.0 has barely concluded, but a new one, leading towards version 10.1, is already underway: "SUSE Linux 10.1 Alpha1 Codename 'Auckland' is ready for testing. New significant changes in 10.1 Alpha1 since 10.0: update to KDE 3.5 Beta1; update to OpenLDAP 2.3.7; update to Linux 2.6.13.2 kernel; YaST does not install the bootloader in the MBR; we use ifplugd by default for network interfaces; a number of package updates and package fixes to reduce compile warnings (especially about missing declarations and aliasing); update of pilot-link packages...." Read the rest of the release announcement for further details.
