Linux distributions are often customized to perform many specialized tasks cater to a particular industry, hobby or business. Today we will take a look at some of best Pen-test distributions out there.

1) BackTrack: Backtrack is the most widely known pen-test distribution out there. The latest release (4 Beta) has been ported to Debian/Ubuntu from Slackware and now can be installed locally as a full distribution and tools can be updated using Backtrack repositories. Backtrack includes more than 300+ security tools.

2) Knoppix STD: As the name suggests this distribution is based on Knoppix and STD stands for Security Tools Distribution. This distribution didn't get any update (like most pen-test distros) in a long time and might not work on some new hardwares but they have a fairly good collection of tools. xfce is used for desktop environment.
