As 2009 comes to an end and the technology industry looks ahead to 2010, it's Chrome OS that could arguably steal the show in the new year. It will be the first desktop operating system Google has ever released. It will also be released with one goal in mind: to beat Windows 7 wherever and whenever it can.

That's a tall order, for sure. Microsoft reigns supreme in the operating-system space. Windows 7, unlike its predecessor Windows Vista, has an opportunity to solidify Microsoft's position in the market with an experience that bests other operating systems on the market. So as Google prepares its Chrome OS for the market, it can't make any mistakes. The more mistakes the company makes, the more difficult it will be for Google to compete. Simply put, Microsoft has applied pressure that will dictate Google's moves going forward.

However, Google has already made mistakes. The search giant is focused on the wrong things. And it could come back to haunt it. Let's take a look at some of the mistakes Google has made.
