I work with Quickbooks Point of Sale which is considered, by most, to be the de facto standard of Point of Sale systems. But for those clients that don't have the budget to afford such a system, I have to turn to other choices. Those who need a simpler inventory/POS system, and want this system to run on the Linux operating system, what is the best option? One choice is LemonPOS.

When I first ran into LemonPOS it had serious installation issues. That has since gone away. Now, getting an instance of Lemon POS is not nearly as difficult as you would expect. In this tutorial I am going to show you how to get LemonPOS up and running and then show you around the tool a bit. NOTE: You will need MySQL up and running in order for LemonPOS to work.
