Novell's openSUSE.org project, launched in August 2005, continues to generate tremendous interest and activity, recently surpassing 13 million page views and 750,000 verified installations of SUSE® Linux. SUSE Linux is installed more than 7,000 times every day, an average of one installation every 12 seconds. The openSUSE? project features easy access to builds and releases, and will soon offer new resources and programs for open access to the development process used to create SUSE Linux, the award-winning distribution that contains everything users need to get started with Linux®. Developers have contributed thousands of suggestions, bug fixes and provided significant input which will improve Novell's leading Linux distribution for developers and customers around the globe.

## In other Novell/Suse news:

Novell plans to release early this year a public development framework and server build for openSUSE.

The framework will give third party ISVs and open source developers new resources and tools -- including code libraries and a public build server -- to streamline code and patch contributions to SUSE Linux, Novell said.

The framework will also enable developers to create packages and applications that run on Novell SUSE Linux or SUSE Linux-based distributions, the Waltham, Mass., company said.
