Sometimes, Google's search engine does a better job of telling us about IT vendors than the vendors' own public relations and marketing machines, which are often there mostly to deflect questions rather than answer them. So it is with the next commercial and development iterations of Oracle's Solaris Unix operating system.

The crawling fingers of Google have found a Sun presentation given sometime this year (there is no date on the document, but it looks to be post-acquisition in late January). The short Solaris roadmap document, which you can see [here](#), was created by Harry Foxwell, a consultant in Oracle's Public Sector unit, on March 18 and is currently sitting on a server at the University of Delaware's Electrical and Computer Engineering department. (Well, probably not for long).

In that document, Foxwell reiterates what Oracle's top brass was saying back at the end of January, which is the last time any official communications came out of Oracle regarding either Solaris, the hardened, commercial-grade Unix, or OpenSolaris, the development version of the platform not really intended for data center production.
