PCLinuxOS is a great distro for individuals who favor rolling updates, performance, and a dedicated community. If you're a first-time Linux user or if you favor aesthetics over technological prowess, better choices are available.

In April 2010, I found myself becoming increasingly disgruntled with Ubuntu (my OS of choice since late 2008). There was no one thing that ruined Ubuntu for me; rather, it was a growing list of inconveniences (10.04 had multiple hardware and software issues on my machine) coupled with regular use of Windows 7 at my place of employment. So I went hunting for a new distro.

After a bit of research, I decided to try PCLinuxOS (version 2010.2). Many individuals had good experiences with the distro, and I liked some of the edgier things it had to offer (BFS instead of CFS, for example). I also liked that there was no server remix ? this was a desktop-only distro, which is exactly what I needed.

First Impressions

Right off the bat, PCLinuxOS impressed by clearly displaying the guest and root passwords on the liveCD background. NICE. More distros should do this.
