It was around 6 months ago that I got in touch with Andrew Wyatt (a.k.a. Fewt, lead developer for Fuduntu) to REVIEW release 14.7 of his distro FUDUNTU. Fewt kindly answered a number of questions which provided context to why Fuduntu was shaping up the way it was.

THE INTERVIEW

I now noticed how Jupiter is making a difference in my battery consumption and also how it automatically applies different power schemas depending on whether the PC is running on batteries or AC. Can you quickly explain what the latest changes in Jupiter are about?

The only recent changes to Jupiter revolve around enabling power savings in hardware devices like your SATA or Audio. I revised Jupiter for kernel 2.6.38 as well where I started managing things like NMI Watchdog.
