Damn Small Linux or DSL was released in 2003 to create a Linux operating system for older hardware. It's based on Knoppix/Debian technology. While your mileage may vary, the basic DSL system requirements are:

486 or better processor

8 M memory for the command line interface (16 M recommended)

16 M memory for the graphical user interface (24 M recommended)

The DSL download is 50 M

DSL's targeted "sweet spot" is:

High-end 486's

Pentium I's

Pentium I MMX's

Low-end Pentium II's
