

Linux Hardware Support Better Than Windows 7

The concept of better is a subjective idea. What is better to me is possibly, even probably, not better to someone else. In my case, and in the case of some of my clients, Linux hardware support is "better". I do not buy cutting edge hardware and tend to keep systems and peripherals until they stop working and can no longer be repaired at a reasonable cost. When a new release of my favorite Linux distribution comes out I can be 100% certain that my hardware that works with my current release will still work with the new release. That is something I just take for granted. This is not so in the Microsoft camp.

For those people who hold on to working hardware through new Microsoft versions, their hardware may or may not be supported in a new release of a Microsoft OS. Take the example of a recent conversation I had with the manager at one of my client offices. I will call her "Mrs. B" here. Mrs. B is a Microsoft fanatic and will not even consider switching to Apple, much less Linux. When I mentioned switching to Linux for her office desktop during our conversation she laughingly said, "Gene, you know better than that.", because we have had that discussion before. This came up in our recent conversation about her HP Photosmart 1115 printer.
