Yesterday I reported on it appearing the 295.40 NVIDIA Linux driver effectively fell off a cliff with a range of performance regressions, stability issues, and other problems. This issue has been confirmed by NVIDIA and they're working to address the situation.

Last week NVIDIA released the 295.40 Linux driver in order to address a high-risk security vulnerability that could allow hackers to gain access to the system memory via the GPU and the un-patched graphics driver. It turns out that the security fix is responsible for these weird issues now being experienced by a number of NVIDIA GeForce Linux users.
